

Mechanical Engineering Technologist Interview Questions

1. What factors do you consider when analyzing energy requirements and distribution systems to maximize the use of intermittent or inflexible renewable energy sources, such as wind or nuclear?

2. What have you found to be the best way to assist engineers to design or develop electrochemical devices, such as solid oxide membranes or other products for sustainable applications? Share an example.

3. What is the most challenging part of preparing cost and materials estimates or project schedules?

4. Name a time when you provided technical support to other employees regarding mechanical design, fabrication, testing, or documentation.

5. What kind of experience do you have interpreting engineering sketches, specifications, or drawings?

6. Share your approach to design specialized or customized equipment, machines, or structures.

7. Tell me about the last time you designed molds, tools, dies, jigs, or fixtures for use in manufacturing processes. Share an example.

8. What have you found to be the best way to conduct failure analyses, document results, and recommend corrective actions?

9. Walk me through how you would assist engineers to design, develop, test, or manufacture industrial machinery, consumer products, or other equipment.

10. What factors do you consider when analyzing or estimating production costs, such as labor, equipment, or plant space?
